Strategies to Improve Cardiac Arrest Survival A Time to Act

National Academies Press *Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.*

5 - Training School-children in Cardiopulmonary Resuscitation: Different Approaches for a Common Goal

Purpose of the study: effectiveness of the CPR education's program in school-children in an Italian region (Veneto), following the recommendations of the World-Health-Organization. Since 2013, the Italian Resuscitation Council (IRC) involved in cardiac arrest awareness with several campaigns [1, 2]. Italy in addition to other 4 countries in Europe have a law system for school-children education's program in CPR, even if the application is not mandatory neither financially supported. These programs are unevenly conducted by the territorial emergency service units in addition to external voluntary contributions. Materials and methods: Data have been collected in the Veneto's area districts from 2013 to 2017. Belluno 2019s Emergency Service conducted courses to children (10-11 years old), where the BLS's sequence was showed by a poster and a short video. The instructor taught the CPR skills, then the hands-on-manikin workshop completed the session. The school-children were instructed to teach the CPR protocol to their relatives with self-directed learning programme attached to mini Anne manikins. Verona 2019s Emergency Service instructed 220 teachers in 41 Secondary schools as well as 201cBLS educators 201d. All the instructors were BLS/IRC certificated. Results: In the Belluno 2019s area district were instructed 3857 children (10-11 years old), that resulted in the 22,3% of all school-children in that age group. Furthermore they were instructed to teach the CPR protocol to their relatives, calculated in 11571. In the Verona 2019s area district, the expectations of the BLS educator program for teachers could be calculated in 7000 schoolchildren (16-17 years old) trained for CPR protocol, that means 50 % of all schoolchildren in that age group. Conclusions: Both the experiences have been successful. Involving the teachers as BLS educators, in addition to the school system, seem to be more effective to get the goal of spreading the CPR knowledge within the population.
