Nauzley Abedini reveals the sensory overload she experienced while conducting a yearlong research fellowship in Kumasi, Ghana, and how accepting that she would never be embraced allowed her to revise her goals and realize that being seen as an outsider is not necessarily incompatible with being accepted or familiar. Ishan Asokan looks back at his time in Amman, the capital city of Jordan, and how he visited a Syrian refugee camp an hour's drive from a bounty of medical aid. He finds countless people suffering, and all he can give them is love.

Navigation and Robotics in Spine Surgery

Thieme A unique how-to guide for spine surgeons on state-of-the-art computer-assisted navigation and robotic surgery techniques The past decade has seen major advances in image-guided spine surgery techniques, with robotically assisted approaches emerging in the last five years. While early adopters of this technology paved the way for more widespread use of navigated and robotic systems, barriers still exist. *Navigation and Robotics in Spine Surgery* by master spine surgeon Alexander Vaccaro and esteemed co-editors Jaykar Panchmatia, I. David Kaye, and Srinivas Prasad addresses existing issues such as the perception of increased upfront costs, intrusion on current workflow, and a lack of understanding about the potential ways these technologies can enhance the surgical experience and improve patient outcomes. Organized into six sections, the book starts with evidence-based fundamentals of navigated spine surgery and robotics including discussion of instrumentation and mechanics. Sections 2-5 serve as a surgical handbook for spine surgeons who wish to introduce these technologies into practice or augment their current repertoire with more complex techniques. Topics range from more routine procedures such as navigated and robotic minimally invasive TLIF to complex approaches like intraoperative ultrasound guided intradural spinal tumor resection. The final section looks at future directions and potential new applications for these technologies. Key Highlights An impressive group of international spine surgeons who pioneered navigation and robotic surgery techniques share invaluable tricks of the trade Discussion of fluoroscopy- and intraoperative CT-based platforms, applications for intraoperative sonography, and radiation exposure and minimization strategies Special topics include OR set-up and workflow, surmounting the learning curve, artificial intelligence, and lessons learned from other industries Procedural videos demonstrate the benefits of computer-assisted navigation and robotic techniques This book is essential reading for orthopaedic surgery and neurosurgery residents and spine fellows who wish to learn about and incorporate these technologies into practice. Seasoned spine surgeons seeking to expand the scope of their navigated/robotic practice will benefit from chapters detailing advanced approaches.

Acutely ill infant

SICS Editore Signs and symptoms are often difficult to interpret in infants, so a complete examination must always be conducted. An infant may present with only a few signs even when seriously ill. The younger the infant, the more likely it is that the illness is serious and will require hospitalization. In practice, 3 months may be considered as the cut off point; particular vigilance should be exercised if the infant is less than 1 month old. Listen to the parents. A detailed history will guide the doctor more quickly towards the right diagnosis, and unnecessary investigations need not be carried out. An afebrile infant with good muscle tone, who feeds well and shows satisfactory growth is rarely seriously ill. If the general condition of the infant is reduced, make an emergency referral for further care in a hospital.
