This has been a valuable review for us and supports that we are moving in the proper direction on attempting to address several of the recommendations." **Models for Estimating Depreciation in Plants, Machinery, and Equipment Analysis and Proposals** This article presents a novel application of the discounted cash flow (DCF) method for assessing percent good factors for secondhand items of machinery and equipment. The process is grounded in the principle of highest and best use and accounts for such factors as the salvage value of equipment and associated property as well as income taxes without requiring cash flow forecasts of the income obtainable from using the equipment. Application of the suggested DCF method to machinery and equipment valuation offers solutions to the following issues, which are elaborated in the article: 1. Formalizing general patterns of change in the value of aging equipment; 2. Recognizing inconsistencies in tabular and analytical methods for determining percent good factors for property tax assessment; 3. Developing new analytical models which consistently describe the dependency of percent good factors on the age of equipment and are practical for the development of property tax assessment depreciation schedules; 4. Determining percent good factors for equipment aged beyond its useful economic life. The most pertinent results may be achieved from this proposed method when the equipment depreciation process is treated in a continuous time formulation. **Annual Survey of Manufactures Expenditures for new plant and equipment, book value of fixed assets, rental payments for buildings and equipment Annual Survey of Manufactures Expenditures for plant and equipment [and] book value of fixed assets [and] rental payments for buildings [and] depreciation and retirements Joint Equipment Committee Report Costs of Railroad Equipment and Machinery, July 1, 1965 : Joint Valuation Signal Committee Report : Signaling and Interlocking, Supplement Thirty-four, July 1, 1965 Basis of Assets Amortization of Machinery and Equipment in Soviet Industry Farm Machinery and Equipment Number and Value of Shipments for Domestic Use, 1935-39 to 1966 Trends in the Oil, Gas, and Water Well Drilling Machinery and Equipment Industry Accounting Demystified Amacom Books At last, an accounting book for the numerically challenged. English Abstract: Evaluation of second-hand machinery and equipment items requires information on the dependence of their market value on the age. Using market price data for these assets, you can get relevant statistical dependence. At the same time we can build a deterministic model of the same dependence based on common valuation principles. It turns out that the result is not consistent with the market data. We can resolve this paradox taking into account the stochasticity of the process of machinery and equipment items use. Built stochastic model allowed us to obtain a simple formula for the mean of the market value of equipment items lived to a certain age. It would seem that the technical condition of the equipment item (and hence its value) should depend not only on its age but also on its operation time. However the analysis showed that operating time of equipment item has little effect on its market value. **The Competitive Edge Research Priorities for U.S. Manufacturing National Academies Press To maintain competitiveness in the emerging global economy, U.S. manufacturing must rise to new standards of product quality, responsiveness to customers, and process flexibility.
