# The Oil Wars Myth

## Petroleum and the Causes of International Conflict

*Cornell University Press* **Do countries fight wars for oil? Given the resource's exceptional military and economic importance, most people assume that states will do anything to obtain it. Challenging this conventional wisdom, *The Oil Wars Myth* reveals that countries do not launch major conflicts to acquire petroleum resources. Emily Meierding argues that the costs of foreign invasion, territorial occupation, international retaliation, and damage to oil company relations deter even the most powerful countries from initiating "classic oil wars." Examining a century of interstate violence, she demonstrates that, at most, countries have engaged in mild sparring to advance their petroleum ambitions. *The Oil Wars Myth* elaborates on these findings by reassessing the presumed oil motives for many of the twentieth century's most prominent international conflicts: World War II, the two American Gulf wars, the Iran-Iraq War, the Falklands/Malvinas War, and the Chaco War. These case studies show that countries have consistently refrained from fighting for oil. Meierding also explains why oil war assumptions are so common, despite the lack of supporting evidence. Since classic oil wars exist at the intersection of need and greed—two popular explanations for resource grabs—they are unusually easy to believe in. *The Oil Wars Myth* will engage and inform anyone interested in oil, war, and the narratives that connect them.**

## Molecular Mechanisms of Neurodegenerative Diseases

*Springer Science & Business Media* **With the unprecedented identification of new mutation mechanisms in neurodegenerative diseases and the emergence of common mechanisms among diseases that were once considered unrelated, neurobiologists are poised for the development of new therapies based on high throughput screenings and a better understanding of the molecular and cellular mechanisms leading to neurodegeneration. In *Molecular Mechanisms of Neurodegenerative Diseases*, Marie-Francoise Chesselet, MD, PhD, and a panel of leading researchers and neurologists from industry and academia critically review the most recent advances from different yet complementary points of view. Focusing on Alzheimer's, Parkinson's, and CAG triplet repeat diseases, the authors show how studies of cellular and genetically engineered animal models have enhanced our understanding of the molecular mechanisms of neurodegenerative diseases and may lead to the development of new therapeutics. Topics include the role of Ab toxicity, glial cells, and inflammation in Alzheimer's disease; the formation of abnormal protein fragments across several diseases, the impact of dopamine and mitochondrial dysfunction on neurodegeneration; and the potential of genetics to identify the molecular mechanisms of neurodegenerative diseases. Authoritative and insightful, *Molecular Mechanisms of Neurodegenerative Diseases* synthesizes the novel ideas and concepts now emerging to create a fresh understanding of neurodegenerative disorders, one that promises to lead to powerful new therapies that prevent, delay the onset, slow the progression, or even cure these cruel diseases.**

By adapting to circumstances unimaginable to most of us, the people in these societies are pioneering the economic infrastructure of the future.
